

Appl. No. 09/917,136
Reply to Office Action of April 8, 2003

-9-

Amy Dkt. No.: D1-5596A
BBL No.: 113963-015

REMARKS

This is in response to the Office Action mailed April 8, 2003, setting a shortened statutory period for response of three (3) months. As this reply has been filed within this time period, it is timely filed. The Commissioner is hereby authorized to charge any additional fees to Deposit Account number 02-1818.

Claims 22-35 and 37-39 are currently pending in the present application. Claim 22 has been amended herein. Claims 145-178 have been added. Claim 22 has been amended to exclude dienes from the polymer blend. Applicants assert that no new matter has been added in light of the above amendments.

The Examiner has rejected all of the pending claims under 35 U.S.C. §102 (b), or alternatively under §103 (a) as being unpatentable over *Babrowicz et al.* (WO 97/36741).

A. Babrowicz et al. Does Not Anticipate or Render Obvious Claims 22-35 and 37-39

Claims 22-35 and 37-39 stand rejected under 35 U.S.C. §102 (b), or alternatively under §103 (a) as being unpatentable over *Babrowicz et al.* (WO 97/36741). Applicants respectfully traverse these rejections and request withdrawal of the same.

Independent claim 22 of the present invention, as amended, is directed to a monolayer film fabricated from non-diene containing polymer blend. The non-diene containing polymer blend contains a first component of a polymeric material capable of being cross-linked and is selected from the group consisting of an ethylene containing polymer, the first component is present in an amount by weight of the film from about 50% to about 95%. The blend further contains a second component which is not readily cross-linkable, and is selected from the group consisting of propylene containing polymers and methyl pentene containing polymers, the second component being present in an amount by weight of the film from about 50% to about 5%. The first and second components each have a melting point temperature determined by DSC, and a portion of the first component is cross-linked, while the second component is essentially free of cross-linking.

Babrowicz et al. discloses a polymer blend and multilayer film utilizing the polymer blend in at least one layer. The polymer blend, which is capable of being cross-linked, must contain a Polymeric Crosslink Enhancer (PCE) which is formed from monomeric units derived from a) at least one polyene monomer, b) at least one C₂-C₂₀ olefinic monomer; and optionally c)

Any Dkt. No.: DI-5586A
BELL No.: 113963-015

at least one or more copolymerizable monomers other than a or b. (See, *Babrowicz et al.* at page 12, lines 13-16). The Examiner states that *Babrowicz et al.* discloses a film containing a blend of a polyolefin such as a metallocene generated ethylene/octene copolymer having a density of 0.901 g/cc, and ethylene propylene diene monomer (EPDM) as in Applicants' propylene containing polymer. (See Office Action of 4/08/03 at page 3, third paragraph).

Babrowicz et al. is particularly directed to the use of a PCE, to selectively enhance the crosslinking with respect to a certain layer or layers of a multilayer film. (See, *Babrowicz et al.* at p. 7, lines 19-27). The PCE, composed of at least one polyene monomer, at least one C₂ - C₂₀ olefin monomer and optionally a third copolymerizable monomer, when added to a film layer results in a higher degree of cross-linking than other layers. (See, *Babrowicz et al.* at p. 7, line 28 to p. 8, line 11). *Babrowicz et al.* defines a polyene as any unsaturated aliphatic or alicyclic compound containing at least four carbon atoms in a chain and having at least two carbon-carbon double bonds. The polyenes exemplified by *Babrowicz et al.* are EPDMs, and the compounds listed on p. 12, line 19 to p. 13, line 12. Thus, the polyenes may be dienes or compounds containing more than two double bonds.

In contrast, the Applicants claim a polymer blend which does not contain a diene and is both cross-linked by irradiation, and capable of forming heat seals. A significant advantage of the present invention is that it provides an irradiated monolayer film structure which is heat sealable.

The inclusion of the limitation in claim 22 of a "non-diene containing polymer blend" does not add new matter. As demonstrated in the examples of the present invention (See, Specification at p. 17-18), several non-diene containing formulations have been developed which meet the claimed physical and performance requirements, such as heat sealing.

The proper test for determining whether a claim limitation finds support in the specification can be found in *Application of Wertheim*, where the CCPA explained that:

[t]he function of the description requirement is to ensure that the inventor had possession, as of the filing date of the application relied on, of the specific subject matter later claimed by him; how the specification accomplishes this is not material. (citation omitted) It is not necessary that the application describe the claim limitations exactly...but only so clearly that persons of ordinary skill in the art will recognize from the disclosure that appellants invented processes including those limitations. (citations omitted)

Appl. No. 09/917,136
Reply to Office Action of April 8, 2003

-11-

Atty Dkt. No.: DI-5596A
BBL No.: 113963-015

Application of Wertheim, 541 F.2d at 262.

The CCPA held in *Wertheim* that applicants were entitled to claim priority to an early filed Swiss application. The Examiner and Board refused to allow a claim of priority because the Swiss application did not provide support for the claimed range of 35-60% solids content in a process claim for making freeze-dried coffee. Instead the Swiss application recited a solids range of from 25% to 60% with examples of a solids content of 36% and 50%. The CCPA reversed stating that there was adequate support for the more narrow range. The CCPA held that the applicants satisfied the written description stating that:

[i] n the context of this invention, in light of the description of the invention as employing solids contents within the range of 25-60% along with the specific embodiments of 36% and 50%, we are of the opinion that, as a factual matter, persons skilled in the art would consider processes employing a 35-60% solids content range to be part of appellants' invention and would be led by the Swiss disclosure so to conclude. (Citation omitted) The PTO has done nothing more than argue lack of literal support, which is not enough. If lack of literal support alone were enough to support a rejection under §112, then the statement of *In re Lukach*, that "the invention claimed does not have to be described in ipis verbis in order to satisfy the description requirement of §112," is empty verbiage. The burden of showing that the claimed invention is not described in the specification rests on the PTO in the first instance, and it is up to the PTO to give reasons why a description not in ipsis verbis is insufficient.

Application of Wertheim, 541 F.2d at 265.

The Court further states:

[t]hat what appellants claim as patentable to them is less than what they describe as their invention is not conclusive if their specification also reasonably describes that which they do claim. Inventions are constantly made which turn out not to be patentable, and applicants frequently discover during the course of prosecution that only part of what they invented and originally claimed is patentable.

Application of Wertheim, 541 F.2d at 263.

In the present case, Applicants' original claims included polymer blends that did not exclude dienes. *Babrowicz et al.* discloses a polymer blend of an EPDM with specific polyolefins including polypropylene. Thus, Applicants have amended the claims to exclude

Appl. No. 09/917,136
Reply to Office Action of April 8, 2003

-12-

Atty Dkt. No.: DI-5596A
BRL No.: 113963-015

polymer blends containing dienes. In support of these amendments, the specification describes several polymer blends suitable for carrying out the present invention which do not contain dienes. Specifically, the examples of disclose blends of: (1) ULDPE and homopolymers of propylene, and (2) ULDPE and propylene and ethylene copolymers, which are capable of forming heat seals. Thus, the disclosure supports the non-diene limitation of the claims, as the examples demonstrate that the use of a diene is not needed to produce the products of the present invention. It further shows that Applicants were in possession of this invention at the time of filing. Accordingly, this amendment does not add new matter.

Applicants respectfully assert that *Babrowicz et al.* fails to anticipate the claimed invention, as amended herein. The present invention, as amended in independent claim 22 is directed to a monolayer film fabricated from non-diene containing polymer blend.

Accordingly, Applicants respectfully request that the rejection of claims 22-35, and 37-39 on the basis of 35 U.S.C. §102(b) and § 103(a) be withdrawn.

B. Babrowicz et al. Does Not Anticipate or Render Obvious New Claims 145-178

New claims 145-161 are directed to a monolayer film fabricated from a two-component polymer blend. The claims disclose a blend *consisting essentially of* a first component of a polymeric material capable of being cross-linked and is selected from the group consisting of an ethylene containing polymer, the first component present in an amount by weight of the film from about 50% to about 95%. The blend further contains a second component which is not readily cross-linkable, and is selected from the group consisting of propylene containing polymers and methyl pentene containing polymers, the second component being present in an amount by weight of the film from about 50% to about 5%. The first and second components each have a melting point temperature determined by DSC, and a portion of the first component is cross-linked, while the second component is essentially free of cross-linking. Claims 145-161 are written to exclude components that would materially affect the blend, such as the PCEs or dienes of *Babrowicz*. For the reasons argued above, claims 145-161 are distinguished from *Babrowicz et al.*

New claims 161-178 are directed to a monolayer film fabricated from a two-component polymer blend. The claims disclose a blend *consisting of* a first component of a polymeric material capable of being cross-linked and is selected from the group consisting of an ethylene

Appl No. 09/917,136
Reply to Office Action of April 8, 2003

-13-

Atty Dkt. No.: D4-5596A
BBL No.: 113563-015

containing polymer, the first component present in an amount by weight of the film from about 50% to about 95%. The blend further contains a second component which is not readily cross-linkable, and is selected from the group consisting of propylene containing polymers and methyl pentene containing polymers, the second component being present in an amount by weight of the film from about 50% to about 5%. The first and second components each have a melting point temperature determined by DSC, and a portion of the first component is cross-linked, while the second component is essentially free of cross-linking. For the reasons argued above, claims 161-178 are written to exclude PCEs or dienes and are thus distinguished from *Babrowicz et al.*

Therefore, Applicants assert that new claims 145-178 do not contain new matter and are distinguished over the disclosure in *Babrowicz et al.*

CONCLUSION

In view of the foregoing remarks, Applicants submit that all pending claims are in a condition for allowance and respectfully request a notice of the same.

Respectfully submitted,
BELL, BOYD & LLOYD LLC

APPLICATION OF WERTHEIM

Case no 541 F.2d 227 (1976)

257

Application of John H. WERTHEIM
et al.

Patent Appeal No. 75-536.

United States Court of Customs,
and Patent Appeals.

Aug. 28, 1976.

Applicant for patent serial No. 96,285, with respect to a process for making freeze-dried instant coffee appealed from a decision of the Patent and Trademark Office Board of Appeals affirming the rejection of all claims in application. The appeal as to certain claims was withdrawn. The Court of Customs and Patent Appeals, Rich, J., held that certain claims were entitled to the benefit of the earlier filing date of Swiss application of applicants and were therefore improperly rejected while certain other claims were not entitled to such earlier filing date and were properly rejected and that certain other claims were properly rejected on ground of obviousness in view of prior art while other claims were improperly rejected on grounds of obviousness.

Affirmed in part and reversed in part.

Baldwin, J., filed an opinion concurring in part and dissenting in part.

Miller, J., filed an opinion dissenting in part and concurring in part.

1. Patents \Leftarrow 90(1)

If patent applicants' parent and Swiss applications complied with specification statute, including description requirement, as to the subject matter of the interference claims, the claims were entitled to filing dates of parent application and Swiss application. 35 U.S.C.A. §§ 112, 119, 120.

2. Patents \Leftarrow 101(5)

Function of description requirement with respect to application is to ensure that inventor had possession, as of filing date of application relied on, of specific subject matter later claimed by him; how specification accomplishes this is not material. 35 U.S.C.A. § 112.

3. Patents \Leftarrow 101(5)

It is not necessary that application for patent describe claim limitations exactly but only so clearly that persons of ordinary skill in the art will recognize from disclosure that applicants invented processes including those limitations. 35 U.S.C.A. § 112.

4. Patents \Leftarrow 101(5)

In determining compliance with description requirement of statute with respect to limitations, the primary consideration is factual and depends on nature of invention and amount of knowledge imparted to those skilled in the art by the disclosure. 35 U.S.C.A. § 112.

5. Patents \Leftarrow 113(7)

On appeal from decision of patent and trademark office board of appeals affirming final rejection of claim, PTO had initial burden of presenting evidence of reasons that persons skilled in art would not have recognized in disclosure a description of invention defined by claims, and by pointing to fact that the claim read on embodiments outside scope of description the PTO satisfied its burden. 35 U.S.C.A. § 112.

6. Patents \Leftarrow 101(2)

Where Swiss application on which applicant for continuation patent relied was filed prior to issuance of United States patent, for purpose of statute relating to specifications in patent application the United States patent disclosure was not evidence of what those skilled in art considered conventional at the time Swiss application was filed. 35 U.S.C.A. § 112.

7. Patents \Leftarrow 90(1)

Claims 1 and 4 of application relating to method for making freeze-dried instant coffee were not entitled to benefit of filing date of applicants' earlier Swiss application for patent since the claims in instant application relied on embodiments employing solids content outside range described in Swiss application.

8. Patents \Leftarrow 101(5)

Where it is clear that the broad described range pertains to a different inven-

4(c)

tion than narrower claimed range, then broader range does not describe narrower range for purpose of statute relating to specifications in application for patent. 35 U.S.C.A. § 112.

9. Patents \Leftarrow 55(1.24), 90(1)

Claims 2, 37 and 38 of patent application relating to process for making freeze-dried instant coffee claiming a solids content range within the described broad range of Swiss application were entitled to benefit of the filing date of the Swiss application which antedated the United States patent, which was not available as a prior art of its 1966 date, so that rejection of such claims was improper. 35 U.S.C.A. §§ 102(e), 103, 112.

10. Patents \Leftarrow 101(11)

Claims 6-10, 12-15, 17, and 26 relating to application for patent for making freeze-dried instant coffee were improperly rejected on ground that limitation of particle size was not described in application as originally filed and was added to the application in violation of statute, since the originally filed specification clearly conveyed to those of ordinary skill in art that applicants invented process in which the particles were of particular size. 35 U.S.C.A. § 132.

11. Patents \Leftarrow 51(1)

Disclosure in prior art of any value within a claimed range is an anticipation of the claimed range. 35 U.S.C.A. § 103.

12. Patents \Leftarrow 18

With respect to patent application relating to process for making freeze-dried instant coffee, claims 6-14, 16, and 21-28 were properly rejected on ground of obviousness in view of the prior art while process claims 17-20 and 29 were improperly rejected on grounds of obviousness. 35 U.S.C.A. § 103.

13. Patents \Leftarrow 18

Apparatus claims 30-35 of application for patent, with respect to a process for

1. A continuation (or continuation-in-part, as the examiner has required it to be designated) of application serial No. 237,672, filed March 28, 1966. Appellants claim the benefit of a Swiss application filed April 2, 1965. The

making freeze-dried instant coffee were properly rejected on grounds of obviousness in view of prior art. 35 U.S.C.A. § 103.

14. Patents \Leftarrow 18

Patent claims 15 and 40-43 of application for patent relating to process for making freeze-dried instant coffee were properly rejected for obviousness in view of prior art.

William H. Vogt, III, Watson, Leavenworth, Kelton & Taggart, New York City, attys. of record, for appellants; Paul E. O'Donnell, Jr., New York City, of counsel.

Joseph F. Nakamura, Washington, D. C., for the Commissioner of Patents; Gerald H. Bjorge, Washington, D. C., of counsel.

Before MARKEY, Chief Judge, and RICH, BALDWIN, LANE and MILLER, Judges.

RICH, Judge.

This appeal is from the decision of the Patent and Trademark Office (PTO) Board of Appeals affirming the final rejection of claims 1-43, all the claims in application serial No. 96,285, filed December 8, 1970, entitled "Drying Method."¹ The appeal on claims 3, 5, 26, and 39 has been withdrawn, and as to these claims it is, therefore, dismissed. As to the remaining claims, we affirm in part and reverse in part.

The Invention

Appellants' invention centers around a process for making freeze-dried instant coffee. Claims 1, 6, 30, and 40 are illustrative:

1. An improved process for minimizing loss of volatiles during freeze-drying of coffee extract which comprises obtaining coffee extract, concentrating said extract to a higher solids level of at least 35%, forming said concentrated extract

title of the application on appeal is somewhat inaccurate, as the application contains claims to apparatus for drying and dried instant coffee products as well as to a drying method.

to a substantial overrun by injection of a gas into said extract at at least atmospheric pressure to thereby avoid evaporative cooling due to evaporation of water in said extract during said foaming, freezing said foam to below its eutectic point at at least atmospheric pressure while avoiding evaporative cooling, and freeze-drying said extract at below the eutectic temperature of said extract.

6. Process for preparing a powdered coffee extract, which comprises adding sufficient inert gas to a concentrated aqueous extract of roast coffee containing about 25% to 60% by weight of soluble coffee solids to provide a foam having a density between about 0.4 and 0.8 gm/cc, freezing the foamed extract to a solid mass, grinding the frozen foam to a particle size of at least 0.25 mm and freeze drying the ground frozen foam.

30. An apparatus for carrying out the process defined in claim 5 comprising, in combination, means for foaming, a closed chamber capable of being maintained at a temperature which is substantially below the melting temperature of said frozen foam, and, disposed within said chamber, a movable endless belt, means for moving said belt at a low speed, a spreading device for distributing coffee extract foam on said belt and refrigerating means for cooling at least one surface of said belt with a liquid refrigerant.

40. A dry coffee powder comprising a freeze-dried particulated foamed extract of roast and ground coffee, the foam before freeze drying having a density between about 0.4 and 0.8 gm/cc.

The remaining claims are reproduced in the Appendix hereto. Appellants assert that their invention produces an instant coffee having a bulk density of 0.2-0.3 gm/cc, which corresponds to that of conventional spray-dried instant coffee.² They allege they discovered that this desired bulk den-

ty results from controlling the solids content of the concentrated extract prior to foaming and the density of the foam generated therefrom within the ranges of their freeze-drying process claims.

Since the claims are somewhat elliptical in setting out the steps of appellants' process, we shall describe it further. An aqueous extract of coffee is prepared by percolating hot water through roasted and ground coffee beans. The extract is concentrated to have a solids content between 25% and 60% and is then charged with gas to produce a foam having a density between 0.4 and 0.8 gm/cc. The foam is frozen and ground into particles, preferably 0.25 to 2.0 mm in size, which are freeze-dried by conventional techniques.

Prosecution History and Rejections

The claims which remain on appeal fall into two broad groups: The "interference" claims 1, 2, 4, 37, and 38; and the "non-interference" claims, 6-35 and 40-43.

As originally filed, the application contained claims 1-5 copied from Pfleger et al. U. S. Patent No. 3,482,990 (Pfleger patent), issued December 9, 1969, on an application filed February 10, 1969. A letter under Rule 205(a), 37 CFR 1.205(a), requesting an interference with the Pfleger patent accompanied the application. By amendment, appellants transferred claims 6-35 from their 1966 application to the instant application. Claims 36-39, added by amendment, are modified versions of the previously copied claims and were presented for the purpose of providing a basis for phantom counts in an interference with the Pfleger patent under Rule 205(a) and Manual of Patent Examining Procedure § 1101.02. They depend from claim 2.

2. So that consumers may continue to use the same amount of freeze-dried instant coffee per cup as conventional instant coffee without

change in the strength of the beverage that they are accustomed to.

The patents relied on by the examiner are:

Pfluger et al.	3,482,990	Dec. 9, 1969
De George	3,253,430	May 31, 1966
	(application filed Feb. 3, 1963)	
Carpenter et al.	2,974,497	Mar. 14, 1961
British patent	948,517	Feb. 5, 1964

The Pfluger patent issued on a chain of four applications: serial No. 890,353, filed Feb. 10, 1969, which was a continuation of serial No. 520,847, filed Jan. 13, 1966 (Pfluger 1966), which was a continuation-in-part of serial No. 309,410, filed Sept. 17, 1963 (Pfluger 1963), which was a continuation-in-part of serial No. 98,007, filed Mar. 24, 1961. The Pfluger patent discloses a process for making freeze-dried instant coffee which has as its goal minimizing the loss from a foamed extract of volatile aromatics which contribute substantially to the natural flavor of coffee and other foods.

De George describes apparatus and methods for freezing liquid, unfoamed coffee extract prior to drying on continuous belts refrigerated by brine tanks contacting the bottom surfaces of the belts. The claims of De George are directed to processes for facilitating the removal of the frozen sheet of coffee extract from the belt before it is freeze dried.

The British patent discloses a rapid freeze-drying process in which the food product is frozen, milled into small particles which are spread from a hopper in single-particle layers onto plates, and freeze-dried in a vacuum chamber. More details of the disclosure are supplied infra.

Carpenter discloses the cooling of a refrigeration belt by spraying cold brine onto the underside of the belt.

The examiner made multiple rejections which were addressed by the board in eight categories, seven of which are before us for review. Category I covers the "interference" claims, which were rejected on the Pfluger patent, claims 1, 2, and 4 under 35 U.S.C. § 102 and claims 37 and 38 under § 103. The board agreed with the examiner's position that these claims were not entitled to the benefit of appellants' 1965 Swiss priority date because they were not supported by appellants' parent and Swiss applications. The limitations held to be unsupported were "at least 35% [solids content]" in claim 1, "between 35% and 60% soluble solids" in claims 2 and 4, and "pressure of less than 500 microns" and "final product temperature of less than 110°F." in claim 4. For that reason appellants were held to be junior to the Pfluger patent on the basis of Pfluger's 1966 filing date. In light of appellants' refusal to file a Rule 204(c)³ affidavit showing a date of invention prior to Pfluger's 1966 filing date, the examiner and the board held the Pfluger patent to be prior art under § 102(c) against claims 1, 2, 4, 37, and 38 and rejected the claims on that basis.⁴ The board refused to hold that the claims were supported in the parent and Swiss applications, "for interference purposes," under our decision in *In re Waymouth*, 486 F.2d 1063, 179 USPQ 627 (Cust. & Pat. App. 1973), mod. on reh., 489 F.2d 1297, 190 USPQ 453 (CCPA 1974). The board stated that appellants' failure to file a Rule 204(c) affidavit precluded any attempt to get into an interference and that Waymouth, which concerned the right to make a claim for interference purposes in the application on appeal, was therefore inapplicable to this case.

3. 37 CFR 1.204(c):

When the effective filing date of an applicant is more than 3 months subsequent to the effective filing date of the patentee, the applicant, before the interference will be declared, shall file two copies of affidavits or declarations by himself, if possible, and by one or more corroborating witnesses, supported by documentary evidence if available, each setting out a factual description of acts and circumstances performed or observed by the affiant, which collectively, would prima

facie entitle him to an award of priority with respect to the effective filing date of the patent. This showing must be accompanied by an explanation of the basis on which he believes that the facts set forth would overcome the effective filing date of the patent.

4. The examiner and the board did not rely on Pfluger 1963 because the solids content and foam density ranges of the copied claims were not described in that application. *In re Lund*, 378 F.2d 982, 54 CCPA 1361, 153 USPQ 625 (1967).

APPLICATION OF WERTHEIM

CPS 60 541 Y 32 287 (10/98)

261

Under Category II, the board affirmed the rejection of claims 6-10, 12-15, 17, and 26 under 35 U.S.C. § 103 for new matter. The board held that these claims, which were added to the instant application by amendment, were not supported in the original disclosure for lack of a description of the claimed size of the ground foam particles, i. e., "at least 0.25 mm."

The Category III rejection was reversed by the board.

In Category IV, claims 6-8, 11-20, and 40-45 were rejected under § 103 on the disclosure of Pfluger 1963⁵ carried forward to the Pfluger patent, in accordance with *In re Lund*, supra. The board found that the foam density range of 0.4-0.8 gm/cc claimed by appellants (and the 0.5-0.8 gm/cc range in claims 19 and 39) was suggested by Pfluger 1963's disclosure of 0.1-0.5 gm/cc foam density and that Pfluger 1963 teaches the use of foaming gases and concentrating the coffee extract prior to foaming. The board found that the final product densities claimed would be inherent "in view of the same foam overrun density disclosed by Pfluger" and that Pfluger's example I, which discloses breaking the frozen foam strands into 1/4" lengths (i. e., "at least 0.25 mm") before drying, would suggest the size of the ground foam particles claimed by appellants.

Category V added De George to the § 103 rejection of claims 9, 10, 30, and 32-35. The board agreed with the examiner that the temperatures, foam thicknesses, and belt lengths and speeds covered by these claims are disclosed in De George, and that it would be obvious to use De George's moving belt apparatus in the Pfluger process.

In Category VI claims 21-23 and 26-29 were rejected under § 103 on Pfluger in view of the British patent, which was relied on for its teaching of the concentration of coffee extract by freezing to a solids content of 27 to 28%. Pfluger was applied to

the claims under the rationale employed in Category IV.

Category VII was the rejection of claims 24 and 25 under § 103 on Pfluger, the British patent, and De George, which was relied on to show "the deposition of a coffee extract on a moving belt prior to grinding and freeze drying." The board otherwise relied on the reasoning in Categories V and VI.

Under Category VIII claim 31 was rejected on Pfluger and De George under § 103 for the reasons of Category V, with reliance on Carpenter to show refrigeration of the belt by spraying refrigerant onto the bottom of the belt instead of using De George's brine tanks.

OPINION

The "Interference" Claims—1, 2, 4, 37, and 38

[1] The dispositive issue under this heading is whether appellants' parent and Swiss applications comply with 35 U.S.C. § 112, first paragraph, including the description requirement, as to the subject matter of these claims. If they do, these claims are entitled to the filing dates of the parent application under 35 U.S.C. § 120; *In re Lukach*, 442 F.2d 967, 68 CCPA 1233, 169 USPQ 795 (1971), and the Swiss application under 35 U.S.C. § 119, *Kawai v. Medeiros*, 480 F.2d 880, 887-88, 178 USPQ 168, 164 (Cust. & Pat.App.1973). Since the PTO relies only on Pfluger 1966 to provide the effective U.S. filing date of the patent as a reference against these claims under §§ 102(e) and 103, a right of foreign priority in appellants' Swiss application will antedate Pfluger 1966 and remove it as prior art against the claims.

The only defect asserted below in appellants' parent and Swiss application discloses that covers all these claims is that the applications do not contain written descriptions of the solids content limitations of the

Appellants have acknowledged this to be true, so it is not necessary to discuss Peebles further.

5. Peebles U. S. patent No. 2,897,064, issued July 28, 1959, was cited against claims 19 and 20 to show that agglomerating fine dried coffee particles into larger grounds was old in the art.

concentrated extract prior to foaming, i. e., "at least 85%" (claim 1) and "between 35% and 60%" (claims 2, 4, 37, and 38).⁶

Appellants' parent and Swiss applications contain virtually identical disclosures on this point. Both disclose that the coffee extract initially produced by percolation of water through ground roasted coffee is concentrated prior to foaming by suitable means "until a concentration of 25 to 60% solid matter is reached." Examples in each disclose specific embodiments having solids contents of 36% and 60%.

In our view, it is necessary to decide only whether the Swiss application complies with the description requirement of § 112 with respect to the questioned limitations. There is no question that the instant application supports claims 1, 2, and 4, which are original claims in that application. Appellants and the solicitor urge us to decide this case by determining whether the broad rule of *In re Waymouth*, supra, is still valid or must be disapproved. In the interest of judicial economy, we decline this entreaty since the issue of whether the Swiss application contains written descriptions of the disputed limitations of claims 1, 2, 4, 37, and 38, being addressed to strict compliance with § 112, first paragraph, is dispositive regardless of the validity of *Waymouth* in its own factual setting. The sufficiency of the parent U.S. application need not be separately decided since appellants must have the benefit of their Swiss application date to antedate the Pfleger patent.

[2.3] The function of the description requirement is to ensure that the inventor had possession, as of the filing date of the application relied on, of the specific subject matter later claimed by him; how the specification accomplishes this is not material.

6. The solicitor belatedly asserts that the Swiss application is not "for the same invention" as the parent application, insofar as claims 1, 2, and 4 are concerned; he argues that the expression "same invention" in 35 U.S.C. § 119 should be given the meaning employed by us in the double patenting cases, e. g., *In re Vogel*, 422 F.2d 438, 37 CCPA 920, 164 USPQ 419 (1970). As we indicated in *In re Ziegler*, 347 F.2d 642, 52 CCPA 1473, 146 USPQ 76 (1965),

In re Smith, 481 F.2d 910, 178 USPQ 620 (Cust. & Pat.App.1973), and cases cited therein. It is not necessary that the application describe the claim limitations exactly, *In re Lukach*, supra, but only so clearly that persons of ordinary skill in the art will recognize from the disclosure that appellants invented processes including those limitations. *In re Smythe*, 480 F.2d 1376, 1382, 178 USPQ 229, 234 (Cust. & Pat.App. 1973).

[4] The primary consideration is *factual* and depends on the nature of the invention and the amount of knowledge imparted to those skilled in the art by the disclosure. The factual nature of the inquiry was emphasized in *In re Rusehig*, 379 F.2d 990, 995-96, 54 CCPA 1551, 1553-59, 154 USPQ 118, 123 (1967), which involved the question whether a broad generic disclosure "described" the single chemical compound claimed:

But looking at the problem, as we must, from the standpoint of one with no foreknowledge of the specific compound, it is our considered opinion that the board was correct in saying:

Not having been specifically named or mentioned in any manner, one is left to selection from the myriads of possibilities encompassed by the broad disclosure, with no guide indicating or directing that this particular selection should be made rather than any of the many others which could also be made.

Appellants refer to 35 U.S.C. § 112 as the presumed basis for this rejection and emphasize language therein about enabling one skilled in the art to make the invention, arguing therefrom that one skilled in the art would be enabled by the specification to make chlorpropamide. We find the argument unpersuasive for two reasons. First, it presumes some mo-

the solicitor's reading is too narrow. All § 119 requires is that the foreign application describe and seek protection for "broadly the same invention" as described in the U.S. application claiming its benefit. 347 F.2d at 649, 52 CCPA at 1481, 146 USPQ at 82. The Swiss application has essentially the same disclosure as appellants' parent application and claims broadly the same invention.

263

0 tivation for wanting to make the com-
 1 pound in preference to others. While we
 2 have no doubt a person so motivated
 3 would be enabled by the specification to
 4 make it, this is beside the point for the
 5 question is not whether he would be so
 6 enabled but whether the specification dis-
 7 closes the compound to him, specifically,
 8 as something appellants actually inven-
 9 ted. We think it does not. Second, we
 10 doubt that the rejection is truly based on
 11 by appellants. If based on section 112, it
 12 is on the requirement thereof that "The
 13 specification shall contain a written de-
 14 scription of the invention * * *."
 15 [Emphasis ours.] We have a specification
 16 which describes appellants' invention.
 17 The issue here is in no wise a question of
 18 its compliance with section 112, it is a
 19 question of fact: Is the compound of
 20 claim 13 described therein? Does the
 21 specification convey clearly to those
 22 skilled in the art, to whom it is addressed,
 23 in any way, the information that appel-
 24 lants invented that specific compound?

or Broadly articulated rules are particularly
 1 inappropriate in this area. See, e.g., *In re*
 2 *Smith*, 458 F.2d 1889, 1894, 59 CCPA 1025,
 3 1033, 178 USPQ 679, 883 (1972), in which
 4 this court felt obliged to overrule a suppos-
 5 ed "rule" of *In re Risse*, 378 F.2d 943,
 6 952-53, 54 CCPA 1495, 1500-01, 154 USPQ
 7 1, 5 (1967). Mere comparison of ranges is
 8 not enough, nor are mechanical rules a sub-
 9 stitute for an analysis of each case on its
 10 facts to determine whether an application
 11 conveys to those skilled in the art the infor-
 12 mation that the applicant invented the sub-
 13 ject matter of the claims. In other words,
 14 we must decide whether the invention appel-
 15 lants seek to protect by their claims is
 16 part of the invention that appellants have
 17 described as theirs in the specification.
 18 That what appellants claim as patentable to
 19 them is less than what they describe as
 20 their invention is not conclusive if their
 21 specification also reasonably describes that
 22 which they do claim. Inventions are con-
 23 stantly made which turn out not to be pa-
 24 tentable, and applicants frequently discover
 25 during the course of prosecution that only a

part of what they invented and originally
 claimed is patentable. As we said in a
 different context in *In re Saunders*, 444
 F.2d 599, 607, 58 CCPA 1318, 1327, 170
 USPQ 213, 220 (1971):

To rule otherwise would let form triumph
 over substance, substantially eliminating
 the right of an applicant to retreat to an
 otherwise patentable species merely be-
 cause he erroneously thought he was first
 with the genus when he filed. Cf. *In re*
Raff, 256 F.2d 590, 597, 45 CCPA 1057,
 1049, [118 USPQ 340, 347] (1958). Since
 the patent law provides for the amend-
 ment during prosecution of claims, as
 well as the specification supporting
 claims, 35 USC 132, it is clear that the
 reference to "particularly pointing out
 and distinctly claiming the subject matter
 which the applicant regards as his inven-
 tion" in the second paragraph of 35 USC
 112 does not prohibit the applicant from
 changing what he "regards as his inven-
 tion" (i.e., the subject matter on which
 he seeks patent protection) during the
 pendency of his application. Cf. *In re*
Brower, 493 F.2d 813, 817, 58 CCPA 724,
 [728], [157 USPQ 684, 687] (1970) (fact
 that claims in continuation application
 were directed to subject matter which
 appellants had not regarded as part of
 their invention when the parent applica-
 tion was filed held not to prevent the
 continuation application from receiving
 benefit of parent's date).

[5] Claims 1 and 4 present little difficul-
 ty. Claim 1 recites a solids content range
 of "at least 55%," which reads literally on
 embodiments employing solids contents out-
 side the 25-60% range described in the
 Swiss application. As in cases involving the
 enablement requirement of § 112, e.g., *In re*
Armbruster, 512 F.2d 676, 185 USPQ 152
 (Cust. & Pat. App. 1975), we are of the op-
 inion that the PTO has the initial burden of
 presenting evidence or reasons why persons
 skilled in the art would not recognize in the
 disclosure a description of the invention
 defined by the claims. By pointing to the
 fact that claim 1 reads on embodiments
 outside the scope of the description, the

264

541 FEDERAL REPORTER, 2d SERIES

PTO has satisfied its burden. Appellants thus have the burden of showing that the upper limit of solids content described, i. e., 60%, is inherent in "at least 35%," as that limitation appears in claim 1. Appellants have adduced no evidence to carry this burden as to claim 1, and they argue only that since the Pfleger patent contains claim 1 supported by Pfleger's disclosure with a stated upper limit of 60%, like appellants' Swiss disclosure, refusal to grant appellants claim 1 amounts to an illegal reexamination of claim 1 in Pfleger. However, as we have often repeated, as recently as *In re Glöfke*, 590 F.2d 397, 188 USPQ 645 (Cust. & Pat. App.1978), it is immaterial in ex parte prosecution whether the same or similar claims have been allowed to others.

[6] Claim 4 contains the additional limitations, relating to the "final product temperature" and the pressure at which the frozen foam is vacuum freeze-dried, of "less than 110°F." and "less than 500 microns." "Final product temperature," it appears, refers to the temperature at which so-called bound water is driven off from the product by heating after the vacuum drying phase has ended. We find no description of final product temperature in appellants' Swiss application. It is not disputed that appellants do not expressly disclose final product temperatures or this secondary drying step. They again appeal, however, to the Pfleger patent disclosure and to an amendment entered in the application on appeal (not objected to as new matter by the examiner) to show that final product temperatures are conventional in the art and need not be expressly disclosed. The amendment is clearly irrelevant since claim 4, an originally filed claim, is its own written description in the appealed application. *In re Gardner*, 475 F.2d 1389, 177 USPQ 336, rehearing denied, 480 F.2d 879, 178 USPQ 149 (Cust. & Pat.App.1973). The issue is whether the Swiss application describes the claimed final product temperature, not whether the instant application does so. The Pfleger

patent disclosure is also unavailable to appellants. The Swiss application was filed before Pfleger issued, which means that for the purposes of § 112 the Pfleger disclosure is not evidence of what those skilled in the art considered conventional at the time the Swiss application was filed. *In re Glass*, 492 F.2d 1223, 181 USPQ 81 (Cust. & Pat. App.1974).⁷

[7] Claims 1 and 4, therefore, are not entitled to the benefit of the filing date of appellants' Swiss application.

[8] Claims 2, 37, and 38, which claim a solids content range of "between 35% and 60%," present a different question. They clearly claim a range within the described broad range of 25% to 60% solids; the question is whether, on the facts, the PTO has presented sufficient reason to doubt that the broader described range also describes the somewhat narrower claimed range. We note that there is no evidence, and the PTO does not contend otherwise, that there is in fact any distinction, in terms of the operability of appellants' process or of the achieving of any desired result, between the claimed lower limit of solids content and that disclosed in the Swiss application. We see an important practical distinction between broad generic chemical compound inventions, for example, as in *In re Buschig*, supra, in which each compound within the genus is a separate embodiment of the invention, and inventions like that at bar, in which the range of solids content is but one of several process parameters. What those skilled in the art would expect from using 34% solids content in the concentrated extract prior to foaming instead of 35% is a different matter from what those skilled in the art would expect from the next adjacent homolog of a compound whose properties are disclosed in the specification. We wish to make it clear that we are not creating a rule applicable to all description requirement cases involving

of a patent claim. See *Brussels v. Lawet*, 218 F.2d 942, 50 CCPA 1367, 138 USPQ 28 (1963); 37 CFR 1.205(a).

7. That the final product temperature limitation is not material, as appellants argue, does not matter when the limitation is copied. Immaturity excuses only failure to copy a limitation

265

The New Matter Rejection

ranges. Where it is clear, for instance, that the broad described range pertains to a different invention than the narrower (and subsumed) claimed range, then the broader range does not describe the narrower range. *In re Rabd*, 348 F.2d 974, 52 CCPA 1747, 146 USPQ 579 (1966); *In re Draeger*, 150 F.2d 672, 32 CCPA 1217, 66 USPQ 247 (1945).

In the context of this invention, in light of the description of the invention as employing solids contents within the range of 25-60% along with specific embodiments of 36% and 50%, we are of the opinion that, as a factual matter, persons skilled in the art would consider processes employing a 35-60% solids content range to be part of appellants' invention and would be led by the Swiss disclosure so to conclude. Cf. *In re Ruchig*, supra. The PTO has done nothing more than to argue lack of literal support, which is not enough. If lack of literal support alone were enough to support a rejection under § 112, then the statement of *In re Lukach*, supra, 442 F.2d at 969, 53 CCPA at 1235, 169 USPQ at 796, that "the invention claimed does not have to be described *in ipso verbis* in order to satisfy the description requirement of § 112," is empty verbiage. The burden of showing that the claimed invention is not described in the specification rests on the PTO in the first instance, and it is up to the PTO to give reasons why a description not in *ipso verbis* is insufficient.

[9] We conclude, therefore, that claims 2, 37, and 38 are entitled to the benefit of the filing date of appellants' Swiss application.

Since the Pfleger patent is not available as prior art as of its 1966 date under §§ 102(e) and 103 against claims 2, 37, and 38, the rejection of those claims is reversed. The rejection of claims 1 and 4 is affirmed. Appellants filed no affidavit under Rule 204(c) showing a date of invention for claims 1 and 4 prior to Pfleger's 1966 filing date. *In re Gemmaser*, 319 F.2d 539, 51 CCPA 725, 138 USPQ 229 (1963), and have not autedated Pfleger as to those claims under 35 U.S.C. §§ 119 and 120.

[10] The issue to be decided here is whether the limitation appearing in claim 6, carried forward into the other claims affected by this rejection, that the frozen foam be ground "to a particle size of at least 0.25 mm" before it is dried, was added to the instant application in violation of 35 U.S.C. § 132. This new matter rejection rests on a finding by the PTO that the application as filed did not describe this limitation. Thus, the converse of what we said in *In re Bowen*, 492 F.2d 859, 864, 181 USPQ 48, 52 (Cust. & Pat.App.1974), is true in this case, namely, that this new matter rejection is tantamount to a rejection of the claims on the description requirement of 35 U.S.C. § 112, first paragraph. The solicitor agrees with this.

We conclude that the originally filed specification clearly conveys to those of ordinary skill in the art that appellants' invented processes in which the frozen foam is ground to a particle size of "at least .025 mm," and not, as the PTO asserts, only processes in which the particle sizes are no larger than 2 mm. See *In re Smythe*, supra.

The specification states, *inter alia* (emphasis ours):

At the end of the [fooling] belt the extract is removed as a continuous rigid sheet which may then be broken up into fragments suitable for grinding. These fragments may, for example, be ground to a particle size which is preferably within the range 0.25 to 2.0 mm.

In a modification of the process, the frozen extract may be freeze-dried in the form of plates or lumps which are subsequently ground to the desired particle size.

The examples speak of drying frozen ground particles of sizes between 0.1 and 2 mm. While the specification indicates that the 0.25 to 2.0 mm range is preferred, we think it clearly indicates that, as an alternative embodiment of appellants' invention,

the foam may be dried in lumps or plates of undisclosed size, which are reduced to the obviously smaller preferred particle size by grinding only after being dried. The solicitor argues that the claimed "range" has no upper limit, wherefore it is not disclosed. The clear implication of this disclosed modification is that appellants' specification does describe as their invention processes in which particle size is "at least 0.25 mm," without upper limit, as delineated by the rejected claims. The rejection of claims 6-10, 12-15, 17, and 29 under 35 U.S.C. § 102 is reversed.

*The "Non-Interference" Claims—6-35
and 40-43*

In the Examiner's Answer, appellants were granted the benefit of the filing date of their Swiss application for claims 16-25, 27-35, and 40-43. The examiner stated: "Claims 6-15 and 26, except for new matter, would otherwise be supported in the Swiss application." Our reversal of the new matter rejection eliminates the basis for the examiner's refusal to give claims 6-15 and 26 the benefit of appellants' Swiss filing date. Appellants' parent and Swiss applications contain the same disclosures concerning particle size as does the application on appeal, and we shall treat all the claims under this heading as entitled to the right of foreign priority claimed by appellants.

Our analysis of these claims will be broken down by the type of claim involved, i. e., process, apparatus, and product, and not as the board addressed them. In each discussion we will apply as prior art under § 102(e) only those portions of the Pfleger patent disclosure that were carried forward from the Pfleger 1963 application (Pfleger 1963) through the two subsequent applications into the patent, as did the board. *In re Lund*, supra.

A. Process Claims 6-14 and 16-29

There are four independent process claims: claim 6, from which claims 7-14, 16, and 17 depend; claim 18; claim 19, from which claim 20 depends; and claim 21, from which claims 22-29 depend.

Pfleger 1963 contains the following disclosure, which, in substance, is carried forward into the patent:

This invention is founded on the discovery that an aqueous aromatic liquid containing solids in suspension and solution may be dried without undergoing loss of aromatic volatiles by a process which comprises foaming the aqueous liquid to a substantial overrun while avoiding evaporation of said aqueous liquid, freezing said foam to below its eutectic point while avoiding evaporation of the aqueous liquid, subliming said aqueous liquid from the frozen foam to reduce the moisture of the foam to at least 10-20%, and further drying the foam to a stable moisture content.

In many applications such foaming can be considerably increased by concentrating the solution or suspension to a relatively high solids content prior to incorporation of air or other gas such as nitrogen therein by first whipping and then freezing the foam, preferably by conductive freezing. During the foaming step, it is essential in order to prevent loss of volatiles to avoid any evaporative cooling of the material, i. e., evaporation of water during the foaming step. Also, during the freezing step evaporative cooling should be avoided. Other ways for creating a frozen foam without undergoing evaporative cooling involve the overt introduction to a solution or suspension of dry ice, i. e., solid carbon dioxide in a suitably ground or particulate form, whereby carbon dioxide gas is liberated upon subliming of the "dry ice" to cause foaming of the solution or suspension to occur. Similarly, refrigerated air or nitrogen can be introduced to the solution or suspension to cause freezing thereof incident to foaming the material. The foam preferably has a high overrun whereby the density of the solution or suspension is changed from above 1.0 gm./cc. to between 0.1-0.5 gm./cc.

Example I, the sole disclosed embodiment in which the foam density is given, shows

APPLICATION OF WERTHEIM

Cite as 361 F.3d 257 (1996)

267

foaming the extract to a density of 0.22 gm/cc.

Claims 19 and 20 recite a foam density of "between about 0.6 and about 0.8 gm/cc," outside the range disclosed by Pfleger 1963. The examiner's position was that Pfleger's disclosure of 0.5 gm/cc as an upper density limit suggests "about 0.6 gm/cc" as the lower limit in the processes of claims 19 and 20 "in the absence of a critical difference between them." We see no such suggestion. By preferring a high foam overrun, i.e., lower rather than higher foam densities, Pfleger 1963 teaches away from employing higher foam densities than its disclosed upper limit of 0.5 gm/cc. Appellants' "about 0.6 gm/cc" lower limit is sufficiently precise to describe foam densities above 0.5 gm/cc and thus outside the range of foam densities that persons of ordinary skill in the art would have been motivated to use by Pfleger 1963's disclosure of a preference for high overrun foams no denser than 0.5 gm/cc. The examiner's comment about the lack of a showing of a critical difference is based on his failure to appreciate that Pfleger 1963 teaches away from increasing foam density. The rejection of claims 19 and 20 under § 103 is reversed.

[11,12] Claims 6-14, 16, 17, and 21-23 recite foam density ranges of "between about 0.4 and 0.8 gm/cc" and solids contents in the range of "about 25% to 60%." Claims 6-10, 12-14, 17, and 26 recite particle sizes of "at least 0.25 mm," claims 16 and 27 say "about 0.25 to 2 mm," claims 11 and 25 recite particle sizes "approximately equal to that of roast and ground coffee," and claims 21-23 do not mention particle size. Pfleger 1963's disclosed foam density range of 0.1-0.5 gm/cc covers values within the scope of all the above-listed claims; the solids contents disclosed in Pfleger 1963 Examples I (27%) and V (30%) are within the claimed ranges of 25-60%. Pfleger 1963 clearly teaches a process for making instant coffee comprising the steps of preparing and concentrating aqueous coffee extract, foaming the extract then freezing the foam, and drying the frozen foam, in that order. Pfleger 1963 teaches fragment-

ing the frozen foam into ¼-inch pieces before drying; ¼ inch is, of course, "at least 0.25 mm." Of course, the disclosure in the prior art of any value within a claimed range is an anticipation of the claimed range. We appreciate the arguments made in *In re Malagari*, 499 F.2d 1297, 182 USPQ 549 (Cust. & Pat.App.1974), and the discussion in *re Orfeo*, 460 F.2d 489, 58 CCPA 1123, 169 USPQ 487 (1971), to the effect that ranges which overlap or lie inside ranges disclosed by the prior art may be patentable if the applicant can show criticality in the claimed range by evidence of unexpected results. The rejections here are under § 103, not § 102, which requires us to consider appellants' argument that their invention and Pfleger's disclosure are directed to different purposes and that persons of ordinary skill in the art would not look to Pfleger 1963 for a solution to the problem addressed by appellants. See *In re Orfeo*, supra.

Appellants' contentions were thus stated in their main brief:

The Board erred at the threshold in failing to appreciate that neither the Pfleger patent nor the 1963 Pfleger application gives any inkling or hint of the inventive concept underlying the rejected claims. . . . The Pfleger disclosures make no mention of product bulk density and contain no suggestion of altering or regulating that density in any manner. Neither does the reference suggest appellants' step of grinding the foam before freeze drying.

One of ordinary skill in the art reading the 1963 Pfleger disclosure would have no inkling of the problem addressed and solved by appellants; and one looking for ways to meet that problem would have no occasion to consider Pfleger or his expedients.

Without an antecedent basis for it in their application, appellants may not use this rationale to show unobviousness. *In re Davies*, 475 F.2d 667, 177 USPQ 381 (Cust. & Pat.App.1973). While appellants do disclose what the bulk density of their product

268

541 FEDERAL REPORTER, 2d SERIES

"usually" is, we find no suggestion in appellants' application that their invention is addressed to the regulation of the bulk density of the product, and the claims make no express reference to such regulation. The only references in appellants' disclosure to this alleged problem and its solution which are apparent to us are (emphasis ours):

After freeze-drying, the coffee extract is obtained in the form of a powder the density of which is usually 0.2 to 0.3 gm/cc.

Drying of the concentrated extract should desirably be carried out under controlled conditions such that the finished product possesses an appropriate density and colour. * * *

The conditions of freezing, notably belt speed, freezing temperature, thickness of foam layer as well as the density of the foam, are factors which have an important influence on the colour of the finished product and should therefore be carefully controlled.

The inadequacy of this disclosure is evident. There is no mention of regulating the final product density or of controlling solids content. We therefore see no basis for depreciating Pfluger as evidence of the scope and content of the prior art, as well as of the level of ordinary skill in this art, as appellants would have us do. Nor is there any factual basis for concluding that the ranges claimed by appellants are critical in themselves to their alleged inventive contribution.

We find no error in the rejection under § 103 of claims 6-14, 16, and 21-28, which recite no final product density. The only difference between claims 6, 12-14, and 16 and the Pfluger 1963 disclosure upon which appellants rely to show the unobviousness of the subject matter of the claims (and which does not relate to solids content or foam density) is the step of "grinding the frozen foam to a particle size of at least 0.25 mm" prior to freeze-drying.³ Pfluger 1963, appellants assert, "fragments" the

3. Appellants do not deny that the features added in claims 7, 12, 13, and 14 are taught in the

frozen foam prior to drying and "grinds" the foam only after it has been dried. As indicated above, the size of the fragments of frozen foam disclosed by Pfluger 1963 is "at least 0.25 mm." We do not think this difference shows the subject matter to be unobvious. Pfluger 1963 implies that the sizes of foam particles before and after drying are comparable; it would have been obvious to reduce the size of the foam particles by suitable mechanical means, whether it be called fragmenting or grinding, to the desired end product size before rather than after drying. Claim 11 differs only in its recitation of final product particle size, which Pfluger 1963 shows is an obvious matter of choice for those of ordinary skill in the art, who know how large ground roasted coffee bean particles are. The commercial motivation for making the particles this size is obvious. Appellants have not argued the patentability separately from claim 6 of claims 9 and 10, which add temperature and foam thickness limitations suggested by Pfluger and De George, as discussed *infra* in considering claims 24 and 25.

Claim 8 likewise recites no final product density, but it requires that the freezing of the foam take place over a period of 7 to 25 minutes, which, appellants' application indicates, produces instant coffee "having a pleasant dark colour." Pfluger 1963 discloses freezing in liquid nitrogen or liquid air, which would be instantaneous, or rapid freezing on a belt, and states further, "The foam may be frozen at a high or a more gradual rate without any apparent difference in the utility thereof insofar as freeze drying is concerned." * * * (Emphasis ours.) Appellants have not shown that only their claimed freezing time produces coffee with a pleasant dark color. Thus, they have not overcome the *prima facie* case of obviousness made out by Pfluger 1963.

In light of appellants' concession in the amendment in which they added claims 37-39 that freeze concentration was known in the art, the rejection of claims 21-23, and

art, and the record shows them to be known in the prior art.

26-28 is little more than a concentration patent, closed by Appella patents those w Claim 2 gases u known the pu respect suffic reason: also re freeze for th supra.

APPLICATION OF WERTHEIM

Case 541 F.2d 287 (1975)

269

26-28 under Category VI, supra, becomes little more than a rejection on Pfleger 1963 alone. With the exception of freeze concentration, which is disclosed by the British patent, every element of claim 21 is disclosed by Pfleger 1963, as indicated supra. Appellants advance no arguments for the patentability of claim 21 different from those we have already rejected for claim 6. Claim 22 adds only a recitation of the inert gases used in the foaming step, which were known in the prior art. Claims 26-28 recite the particle sizes of claims 6, 16, and 11, respectively; these particle sizes are not sufficient to show unobviousness for the reasons given supra. Claim 29, which was also rejected under Category VI, recites the freezing time of claim 8. It is unpatentable for the same reasons given for claim 8, supra.

Claims 24 and 25, to which Pfleger 1963, De George, and the British patent were applied under § 103, call for the temperature and foam limitations already discussed under claims 9 and 10, supra. Temperature and foam thicknesses within the claimed ranges are disclosed by Pfleger 1963 in Example VI (freezing foams at -30°F. on a belt and subsequently loading foam onto trays to a 1-inch (approx. 25 mm) depth for vacuum drying). Appellants do not allege that the ranges of claims 24 and 25 are critical.

Claims 17, 18, and 29, on the other hand, recite the bulk density of the final product made by each process in positive terms. The board dismissed these final product density limitations as being merely recitations of the inherent result of observing the foam density and solids content ranges set forth in these claims. Although we found above that appellants' specification as filed does not disclose regulating product density by controlling the foam density and solids content in the process and that claims which failed to recite controlled product density could not rely on this feature to distinguish over the prior art under § 103, these claims do require such regulation or control, by implication through their ex-

press recitation of the density of the final product to be obtained from the processes they delimit. That persons skilled in the art may not know how to ensure the claimed final product densities from the specification is pertinent only to a rejection on the enablement requirement of § 112, first paragraph, which is not before us. The only question here is whether the subject matter of claims 17, 18, and 29, the scope of which is unquestionably clear, is obvious under § 103.

Pfleger 1963 discloses no final product densities and contains no teaching on how to achieve any particular final product density from practicing its process. The inherency of final product density adverted to by the board can be gleaned only from appellants' disclosure, if anywhere, which may not be used against them as prior art absent some admission that matter disclosed in the specification is in the prior art. *In re Kuehl*, 475 F.2d 638, 177 USPQ 250 (Cust. & Pat.App.1973); cf. *In re Nomura*, 509 F.2d 566, 184 USPQ 607 (Cust. & Pat.App.1975). In the absence of disclosure of final product densities or how to achieve any desired density in the prior art applied by the PTO to claims 17, 18 and 29, we cannot say that the subject matter of these claims would have been obvious to persons of ordinary skill in the art.

The rejection of process claims 6-14, 16, and 21-23 is affirmed; the rejection of claims 17-20, and 29 is reversed.

B. Apparatus Claims 30-35

[13] The preamble of independent claim 30, carried forward into claims 31-35, recites that the apparatus is "for carrying out the process in claim 6." Appellants contend that this preamble gives "life and meaning" to the claims, serving to define the interrelationship of the mechanical elements recited in the body of the claims. This argument appears to be based on *Kropa v. Rohie*, 187 F.2d 150, 88 CCPA 838, 88 USPQ 478 (1951), the classic case in this court on the construction of claim preambles. In *Kropa* the court surveyed prior cases and

270

541 FEDERAL REPORTER, 2d SERIES

said, 187 F.2d at 152, 38 CCPA at 861, 88 USPQ at 480-81:

[I]t appears that the preamble has been denied the effect of a limitation where the claim or count was drawn to a structure and the portion of the claim following the preamble was a self-contained description of the structure not depending for completeness upon the introductory clause. . . . In those cases, the claim or count apart from the introductory clause completely defined the subject matter, and the preamble merely stated a purpose or intended use of that subject matter.

While we do not subscribe to the broad proposition that process limitations can never serve to distinguish the subject matter of apparatus claims from the prior art, we fail to see how the general process parameters of claim 6 require an arrangement of the apparatus means recited in claims 30-35 more specific than that set forth in the body of each claim. In no claim is the preamble relied on to provide an antecedent basis for terms in the body. See *In re Higbee*, 527 F.2d 1405, 188 USPQ 488 (Cust. & Pat.App.1976). The context of each invention is clear without reference to claim 6, unlike the situation in *Kropa*, supra, in which the preamble "An abrasive article" was the only portion of the claim defining the relationship of the components recited in the body of the claim; the court said, "The term calls forth a distinct relationship between the proportions of grain and resin comprising the article." 187 F.2d at 152, 38 CCPA at 862, 88 USPQ at 481.

Appellants do not argue the patentability of claims 32-35 separately from claim 30 and concede that Carpenter discloses the feature added in claim 31. We find that the teachings of Pfleger and De George (and Carpenter on claim 31) show that the subject matter of claims 30-35 would have been obvious to persons of ordinary skill in the art. These references are to be viewed for what they disclose in their entireties and not merely for their inventive contributions to the art. *In re Ogino*, 517 F.2d 1352, 1387, 188 USPQ 227, 232 (Cust. & Pat.App. 1975).

Pfleger 1963, in a portion carried forward to the patent, discloses the following:

Advantageously, in following the teachings of the present process either in a vacuum freeze drying application or in an atmospheric freeze drying application, the frozen foamy mass may be arranged for either batch or continuous processing in any one of a variety of conventional plant handling applications. Thus, the foamy mass can be readily transferred from one food handling station to another, deposited in trays or continuous belts, superposed on one another or otherwise conventionally located in the vicinity of the freeze drying influences. In the case of a typical freeze drying operation the foams may be frozen and deposited onto trays stacked one above the other on a suitable heat transfer surface in a vacuum chamber. In the case of an atmospheric freeze drying application the foams can be stacked one upon the other upon a foraminous drying member permitting the circulation of the drying medium, e. g. dry air, helium or nitrogen. Throughout all of such freeze drying applications it is imperative that the temperature of the foamy mass be maintained below the eutectic point of the material while drying to assure that the foam stays in a substantially solid or frozen state as distinguished from a melted or semi-liquid state, dehydration of the mass being achieved by a process of sublimation as distinguished from one of evaporation. Such conditions should be followed at least until the moisture content of the foamy mass has been substantially reduced to a point where it has lost at least a majority of its moisture and preferably is superficially dry to the touch, i. e. in the neighborhood of 10-20% moisture by weight.

Example VI of Pfleger 1963, which is carried forward as Example III of the Pfleger patent, shows heat controlling the vacuum chamber to assure a product temperature below -10°F. (De George teaches that the melting point of a 28% solids content extract is about 27°F., whereas the eutectic temperature is constant regardless of con-

centration at about -33.5°F). De George discloses the use of endless belts, low speeds, and refrigerating means, and appellants, while arguing that De George treats the handling of solid slabs of frozen extract on refrigeration belts and not frozen foamed extracts, do not and cannot deny that De George discloses apparatus that persons of ordinary skill in the art would have deemed suitable for handling foams in the manner shown by Pfluger. Appellants also contend that neither reference discloses the "spreading device" recited in the claims, Pfluger 1963 showing only the application of $1/4$ " diameter ribbons of foam through a nozzle to stationary freeze drying trays. The reference in the portion of Pfluger 1963 quoted supra to the deposition of the foam on the belts is simple suggestion, in our opinion, that some means must be employed to apply the foamy mass to the continuous belts. The term "spreading device" is not defined in any special way by appellants and is broad enough to be the means for applying the foam to the belt suggested by Pfluger. The rejection of claims 30-35 is affirmed.

C. Product Claims 15 and 40-43

[14] These claims are cast in product-by-process form. Although appellants argue, successfully we have found, that the Pfluger 1963 disclosure does not suggest the control of bulk density afforded by appellants' process, the patentability of the products defined by the claims, rather than the processes for making them, is what we must gauge in light of the prior art. See *In re Bridgeford*, 357 F.2d 679, 32 CCPA 1182, 149 USPQ 55 (1966). Each of these claims defines a freeze-dried instant coffee product made by processes which, appellants have contended with respect to their process claims, produce, by virtue of the foam density and solids content ranges taught by

appellants, products having a bulk density comparable to spray-dried instant coffee, i.e., 0.2-0.3 gm/cc as indicated in appellants' specification. The solids content and foam density ranges disclosed by Pfluger 1963 overlap those of appellants, and, it appears, the Pfluger process using solids contents and foam densities overlapping those of appellants will produce instant coffee which is indistinguishable from appellants' products. There is no evidence showing that Pfluger's product prepared, for example, using an extract of 30% solids content foamed to a density of 0.5 gm/cc differs from appellants' claimed products in any way, certainly not in any unobvious way. See *In re Avery*, 518 F.2d 1223, 1233-34, 186 USPQ 161, 165-66 (Cust. & Pat.App.1975). That some of the products covered by appellants' claims may not be disclosed or suggested by Pfluger 1963 is not relevant to patentability, since the claims embrace other subject matter completely disclosed by Pfluger 1963, complete disclosure in the prior art being the epitome of obviousness. *In re Pearson*, 494 F.2d 1399, 181 USPQ 641 (Cust. & Pat.App.1974). The rejection of these product claims under § 103 on Pfluger³ is affirmed.

Conclusion

The appeal is dismissed as to withdrawn claims 3, 5, 36, and 39. The decision of the board is affirmed as to claims 1, 4, 6-16, 21-28, 30-35 and 40-43, and is reversed as to claims 2, 17-20, 29, 37, and 38.

MODIFIED

rejection because of failure of the PTO to give clear reasons for its action under 35 U.S.C. § 132, and we find the explanations given by the examiner and board with respect to claims 40-43 to have been legally ample under § 132. Cf. *In re Gustafson*, 331 F.2d 905, 51 CCPA 1358, 141 USPQ 585 (1964).

3. Appellants argue in their reply brief that claims 40-43 "were never the subject of an accurate or proper rejection," because the examiner and the board incorrectly grouped them with other claims. As we have indicated, the rejection of claims 40-43 on Pfluger under § 103 was "proper"; appellants do not contend that they could not understand the basis for the

3. The process of claim 2 wherein the concentrated extract is foamed to an overrun density of between 0.1 to 0.7 gm/cc.

4. The process of claim 2 wherein the frozen foam is vacuum freeze-dried at a pressure of less than 500 microns and a final product temperature of less than 110°F.

5. The process of claim 3 wherein the frozen foam is vacuum freeze-dried at a pressure of less than 500 microns and a final product temperature of less than 110°C.

7. A process according to claim 6 in which said inert gas is at least one of the following gases, namely carbon dioxide, nitrous oxide and nitrogen.

8. A process according to claim 6 in which the foam is frozen during 7 to 25 minutes.

9. A process according to claim 6 in which the foam is frozen on a moving belt which is cooled to a temperature between -12 and -70°C.

10. A process according to claim 6 wherein the foam is spread on the belt at a layer thickness of 10 to 40 mm.

11. A process according to claim 6 in which the frozen foam is ground, before freeze-drying, to a particle size approximately equal to that of roast and ground coffee.

12. A process according to claim 6 in which an aromatic condensate obtained by stripping roast and ground coffee is added to said concentrated extract before it is transformed into a foam.

13. A process according to claim 6 in which, after freeze-drying, the powdered coffee extract is aromatised by incorporation therein of 0.1 to 0.5% by weight of an aromatic condensate obtained by stripping of roast and ground coffee.

14. A process according to claim 13 in which said condensate is incorporated in said powdered extract in admixture with an oily carrier.

15. The coffee extract obtained by the

16. Process according to claim 6 in which the frozen foam is ground to a particle size of about 0.25 to 2.0 mm.

17. Process according to claim 6 in which the freeze dried extract has a density of about 0.2 to 0.3 gm/cc.

18. Process for preparing a soluble coffee extract, which comprises adding inert gas to a concentrated aqueous extract of roast coffee having a solids content of about 25% to about 60% to provide a foam, freezing the foam to a solid mass, reducing the frozen foam to particles having a size of about 0.25 to 2.0 mm and freeze drying the frozen particles, the amount of inert gas added to the aqueous extract being sufficient to provide a freeze dried extract having a density between about 0.2 and 0.3 gm/cc.

19. Process for preparing a powdered coffee extract which comprises adding sufficient inert gas to a concentrated aqueous extract of roast coffee to provide a foam having a density between about 0.6 and about 0.8 gm/cc, freezing the foamed extract to a solid mass, grinding the frozen foam to an average particle size of 0.1 to 0.5 mm, freeze drying the ground particles to provide a finely powdered coffee extract, and agglomerating the finely powdered coffee extract.

20. Process according to claim 19, in which the powdered extract is agglomerated to provide an agglomerate having a density of about 0.2 to 0.3 gm/cc.

21. Process for preparing a powdered coffee extract which comprises increasing the soluble coffee solids content of an aqueous extract of roast ground coffee to about 25%-60% by freeze concentration, separating the concentrated extract from ice crystals, adding an inert gas to the concentrated aqueous extract to provide a foam having a density between about 0.4 and 0.8 gm/cc, freezing the foam to a solid mass and freeze drying the frozen foam.

22. Process according to claim 21 in which the inert gas is selected from the group consisting of carbon dioxide, nitrous

APPLICATION OF WERTHEIM

Class 241 F.24.257 (1976)

273

APPENDIX—Continued

23. Process according to claim 21 in which the foam is frozen during 7 to 25 minutes.

24. Process according to claim 21 in which the foam is frozen on a moving belt which is cooled to a temperature between -12 and -70°C.

25. Process according to claim 24 wherein the foam is spread on the belt at a layer thickness of 10 to 40 mm.

26. Process according to claim 21 in which the frozen foam is ground before freeze drying to a particle size of at least 0.25 mm.

27. Process according to claim 26 in which the frozen foam is ground to a particle size of about 0.25 to 2mm.

28. Process according to claim 21 in which the frozen foam is ground before freeze drying to a particle size approximately equal to that of roast and ground coffee.

29. Process according to claim 21 in which the freeze dried extract has a density of about 0.2-0.3 gm/cc.

31. An apparatus according to claim 30 in which the means for cooling the belt includes a plurality of aprinklers disposed to spray the refrigerant onto the underside of the belt.

32. An apparatus according to claim 30 in which the belt comprises two sections each provided with separate cooling means, the first of said sections being cooled to a temperature of -12 to -29°C and the second section to -40 to -70°C.

33. An apparatus according to claim 30 also comprising means for fragmenting and milling the frozen foam.

34. An apparatus according to claim 30 in which the length of said belt is 15 to 25 metres and the driving means is adapted to move said belt at a linear speed of about 0.5 to 1.5 m/min.

35. An apparatus according to claim 30 in which said chamber is adapted to be maintained at a temperature of -25 to -45°C.

36. The process of claim 2 wherein the concentrated extract is foamed to an overrun density of between about 0.1 to 0.8 gm/cc.

37. The process of claim 2 wherein the concentrated (60%) extract is foamed to an overrun density of between 0.4 to 0.8 gm/cc.

38. The process of claim 2 wherein the frozen foam is vacuum freeze-dried at a pressure of about 150 to 175 microns.

39. The process of claim 3 wherein the frozen foam is vacuum freeze-dried at a pressure of about 150 to 175 microns.

41. A coffee powder according to claim 40 wherein the extract before freeze drying contains about 25% to 60% by weight of soluble coffee solids.

42. A dry coffee powder having a density of about 0.2 to 0.3 gm/cc and comprising a freeze dried particulated foamed extract of roast and ground coffee, said extract containing before freeze drying up to about 60% by weight of soluble coffee solids.

43. A coffee powder according to claim 42 containing about 0.1% to 0.5% by weight of aromatic condensate obtained by stripping roast and ground coffee.

BALDWIN, Judge (concurring in part and dissenting in part).

I agree with Judge Miller's treatment of claims 17-20 and 29. Otherwise, I join the majority opinion.

MILLER, Judge (dissenting in part and concurring in part).

I dissent on claim 1. The error of the majority in affirming the rejection stems from a misstatement of the issue. It is not necessary when antedating a reference under 35 U.S.C. § 102(a) or (e) to establish a prior reduction to practice, constructive or actual, of all the subject matter falling within the claims. It is necessary only to establish a reduction to practice of sufficient subject matter to render the claimed invention obvious to one of ordinary skill in the art. *In re Spiller*, 500 F.2d 1170, 182 USPQ 614 (Cust. & Pat.App.1974). The

274

541 FEDERAL REPORTER, 2d SERIES

majority errs, therefore, in seeking a description in appellants' parent and foreign priority applications to support the entire claimed subject matter as though these were the applications in which the claims appear. See *In re Ziegler*, 347 F.2d 642, 52 CCPA 1473, 146 USPQ 76 (1966). Appellants have clearly shown possession of enough of the invention to entitle Pfluger 1966 by establishing a prior constructive reduction to practice in their parent and foreign applications of specific embodiments disclosing concentrating to 60% and 80% total solids and by a broader disclosure of "25 to 60%."

Although the rejection of claim 1 arises in the context of an attempt to initiate an interference, the rejection is clearly under 35 U.S.C. § 102(a) or (c) and not under Rule 204(c), 37 CFR 1.204(c). Even if the rejection were under that rule, the substance of the rule's requirement for evidence sufficient to establish a prima facie case for a judgment of priority against Pfluger 1966 would be satisfied by the prior constructive reduction to practice of embodiments within claim 1 in appellants' parent and foreign applications. *Hunt v. Treppschuh*, 523 F.2d 1386, 187 USPQ 429 (Cust. & Pat.App.1975); *Pontijn v. Okamoto*, 518 F.2d 610, 136 USPQ 97 (Cust. & Pat.App.1975).

The majority cites *In re Gemasmer*, 319 F.2d 599, 51 CCPA 726, 138 USPQ 229 (1963), to support its decision on claim 1. It suffices to note that Gemasmer was decided more than a decade before *In re Spiller*, *Hunt v. Treppschuh*, and *Pontijn v. Okamoto*, supra.

I concur in the decision on claim 4 since appellants' parent and foreign applications are silent regarding final product temperature and a secondary heating step and, therefore, fall even as a constructive reduction to practice of the invention of claim 4.

I concur also in the decision on claims 19 and 20, but I do not find it necessary to hold, as the majority implicitly does, that "about 0.6" gm/cc excludes 0.5 gm/cc disclosed in the reference as the upper limit of merely a preferred range. Moreover, it is obvious from the reference that the process would work at a higher density than 0.5, although inferior results might be expected. My concurrence rests on the requirement of claims 19 and 20 of a specific sequence of steps not suggested by the prior art, namely: providing a high density of about 0.6 to about 0.8 gm/cc, grinding to a fine particle size prior to freeze drying, freeze drying, and finally agglomerating the fine particles into larger particles. This achieves a "highly coloured product of regular particle size." There is no suggestion in the prior art of deliberately grinding to a fine size and then agglomerating to a larger size.

I dissent on claims 17, 18, and 20, because there is at least a prima facie relationship between product and foam densities. The board noted this by stating that "the freeze dried density of the coffee would be inherent in view of the same range of foam overrun density disclosed by Pfluger." Since the foam densities and other conditions disclosed by Pfluger for the process claimed are approximately the same, appellants should be required either to show that the reference does not achieve the same product densities or to establish critically. Since they have not done so, I would affirm the rejection of claims 17, 18, and 20.
